# OSCE Checklist: Blood Pressure Measurement

## Introduction

1. Introduce yourself to the patient including your name and role
2. Confirm the patient’s name and date of birth
3. Briefly explain what the procedure will involve using patient-friendly language
4. Gain consent to proceed with blood pressure measurement
5. Position the patient sitting on a chair, with their arm comfortably placed at heart level
6. Check if the patient has a preference as to which arm to use: avoid using an arm that has local pathology such as post-mastectomy lymphoedema
7. Ask the patient to adequately expose their upper arm on the relevant side by rolling up their sleeve
8. Ask the patient if they have any pain before proceeding with blood pressure measurement
9. Wash your hands.

## Attaching the blood pressure cuff

10. Check that the blood pressure cuff size is appropriate for the patient’s arm and that it is fully deflated
11. Confirm the location of the brachial artery by palpating medial to the biceps brachii tendon and lateral to the medial epicondyle of the humerus
12. Wrap the blood pressure cuff around the patient’s upper arm, lining up the cuff marker with the brachial artery

## Measuring blood pressure

13. Ensure the valve on the blood pressure cuff is closed
14. Palpate the patient’s radial pulse, located at the radial side of the wrist, with the tips of your index and middle fingers aligned longitudinally over the course of the artery
15. Inflate the blood pressure cuff until you can no longer feel the patient’s radial pulse. Note the reading on the sphygmomanometer at the point at which the radial pulse becomes impalpable. This reading is an approximate estimate of the patient’s systolic blood pressure.
16. Open the valve and deflate the blood pressure cuff
17. Close the valve on the blood pressure cuff
18. Position the diaphragm of your stethoscope over the brachial artery
19. Re-inflate the cuff 20-30 mmHg above the systolic blood pressure you previously estimated
20. Then slowly deflate the cuff at around 2-3 mmHg per second
21. Identify the first Korotkoff sound
22. Identify the fifth Korotkoff sound

## To complete the procedure...

23. Once an blood pressure has been obtained, remove the blood pressure cuff
24. Explain to the patient that the procedure is now complete
